Biology is the study of LIFE. It is the exciting study of how living systems do their business: How plants produce nearly every bite of edible food through photosynthesis. How microorganisms reproduce and acquire resistance to antibiotics, how they produce disease, and how they benefit our lives. It is the study of animal development from conception through maturation, reproduction, senescence and then ultimately to death. It is the study of how we perceive our world through our amazing senses, and it is the study of the very brain we use to process this information and everything about our world. It is the study of the great diversity of living things on Earth and how they interact with each other and with human society. Biology tells us who we are in this vast living world. It tells us where we came from, and it tells us where we might go as a species.
