VOLUNTEERS NEEDED
for a groundbreaking research study examining genetic risk factors for Alzheimer’s disease

What is the purpose of this study?
Join this study to help researchers determine whether an FDA-approved cholesterol lowering medicine, gemfibrozil, can change Alzheimer’s pathways in the brain and potentially serve as a model for future drug development in Alzheimer’s research.

What is involved in this study?
Participation in this research study involves 9 visits to the clinic over approximately one year. These visits will include MRI brain imaging, blood work and spinal fluid collection, routine physical exams, and brief memory testing. Your health will be closely monitored by a team of doctors and medical staff, at no cost to you.

Researchers are looking for persons who:
- Are between 65 and 90 years of age
- Either have a diagnosis of mild cognitive impairment or have normal memory and thinking
- Are in good general health
- Are not currently taking a cholesterol lowering medication
