What is the purpose of this study?
The purpose of this study is to gather information on how safe and effective an experimental drug, RVT-101, is in improving cognition and performance of activities of daily living in people with dementia with Lewy bodies.

What is involved in this study?
Participation in this research study involves 13 visits to the clinic over approximately 8 months. These visits will include MRI or CT brain imaging, blood work, routine physical exams, and memory testing. Your health will be closely monitored by a team of doctors and medical staff, at no cost to you.

Researchers are looking for persons who:
- Individuals with a diagnosis of Dementia with Lewy Bodies
- Are 50-85 years of age
- Able to ingest pills
- Has a caregiver who is willing to attend visits and answer questions
- Are in generally good health
