

# 329343D02 ROOT OBSERVATION DETAIL - CONTAINER

## ACCEPTABLE

The point where top-most root(s) emerges from the trunk (root collar) should be within the top 2" of substrate. The root collar and the root ball interior should be free of defects including circling, kinked, ascending, and stem girdling roots. Structural roots shall reach the periphery near the top of the root ball.

Roots radiate from trunk and reach side of root ball without deflecting down or around.

## REJECTABLE

Structural roots circle interior of root ball. No structural roots are horizontal and reach the root ball periphery near the top of the root ball.

Only absorbing roots reach the periphery near the top of the root ball. Structural roots mostly wrap or are deflected on the root ball interior.

Structural roots descend into root ball interior. No structural roots are horizontal and reach the root ball periphery near the top of the root ball.

Structural roots circle and do not radiate from the trunk.

Structural roots primarily grow to one side.

Structural roots missing from one side, and/or grow tangent to trunk.

### Notes:

- 1- Observations of roots shall occur prior to acceptance. Roots and substrate may be removed during the observation process; substrate/soil shall be replaced after observation has been completed.
- 2- Small roots ( $\frac{1}{4}$ " or less) that grow around, up, or down the root ball periphery are considered a normal condition in container production and are acceptable however they should be eliminated at the time of planting. Roots on the periphery can be removed at the time of planting. (See root ball shaving container detail).
- 3- See specifications for observation process and requirements.
