A critical requirement for producing an excellent fruit crop is knowing the nutritional status of your planting. The only way that the nutritional status can be assessed is through foliar analysis. Soil tests provide only a portion of the picture and tell what is in the soil. Tissue analysis shows which nutrients the plant is actually absorbing and facilitates fine tuning of the fertilization program. It lets the grower know when an element is becoming deficient before symptoms show up and allows for correction of the problem before fruit quality and yield suffer. It is not necessary to sample a block every season, because nutrient levels do not change that rapidly. It is generally recommended that a block be sampled once every three years.

Since the University of Kentucky does not have a facility for conducting plant analysis for growers, we recommend that you send your plant samples to a lab that will process your samples and provide results that are consistent with our recommended sampling periods as described in our Midwest Tree Fruit Pest Management Handbook and the Midwest Small Fruit Pest Management Handbook. Both of these publications are available on the web at http://www.uky.edu/Ag/Horticulture under Commercial Horticulture and Fruit.

The following labs have tissue analysis programs that work well with our midwest tissue analysis sampling periods. Growers should call the labs to purchase pre-paid kits, available from several of the labs and to obtain specific directions from the particular lab as well as an update on analysis cost. Most of these analyses include the standard 10 elements, nitrogen, phosphorus, potassium, calcium, magnesium, manganese, iron, copper, boron, and zinc.

A & L Analytical Labs, Inc. (Cost: $26.00)
2790 Whitten Road
Memphis, TN 38133
Phone: (800) 264-4522 or (901) 213-2400
http://www.allabs.com

Cornell Nutrient Analysis Lab (Cost: $30.00)
G01 Bradfield Hall
Cornell University
Ithaca, NY 14853
Phone: (607) 255-4540
http://cnal.cals.cornell.edu

Penn State University (Cost: $24.00)
Agricultural Analytical Services Laboratory
The Pennsylvania State University, Tower Rd.
University Park, PA 16802
Phone: (814) 863-0841
http://www.aasl.psu.edu/plants.html

Waters Agricultural Laboratory (Cost: $15.00)
2101 Calhoun Rd., Hwy 81
Owensboro, KY 42301
Phone: (270) 685-4039
http://www.watersag.com

The time of sampling is extremely important to obtain a correct analysis. Table 1. summarizes the sampling procedure and timing for most of our major fruit crops. These sampling periods correspond to the time for which we have nutrient level standards and are periods where the levels are somewhat stable in the plant.
In sampling, select only healthy leaves from healthy plants. Collect leaves at random throughout a block from one cultivar and one rootstock on a similar soil type. Leaves from young (nonbearing) and old (bearing) cultivars should not be mixed, since the nutritional needs of young and older plants are different.

Dust or pesticides on the leaves will affect the analysis, particularly for zinc, manganese and iron. Select clean leaves or the leaves may be washed. Dirty leaves should be washed very quickly in water with a small amount of liquid dishwashing soap and then rapidly rinsed through two containers of water. Leaves should then be air dried on a paper towel and sent to the tissue analysis lab.

Proper interpretation of the tissue analysis requires that a soil sample be taken at the same time or there should be a recent analysis from the block where the tissue sample was taken. The laboratory will send the results of the tissue analysis directly to the grower with recommendations. **Kentucky growers should request that the lab send a copy of the analysis to John Strang for additional interpretation using their soil sample results.** Please include the following address on the foliar analysis form.

John Strang  
Dept. of Horticulture  
N-318 Ag. Science Bldg. North  
Univ. of Kentucky  
Lexington, KY 40546  
(859) 257-5685
