OIL AND GAS MAP OF THE MIDDLESBORO 30 x 60 MINUTE QUADRANGLE, KENTUCKY

Anna G. Watson

The purpose of the oil and gas maps is to portray the distribution of oil and gas resources in a manner easier to read and gas resources in a manner easier to read and some indication of production potential. The maps are based on the Kentucky Geological Survey oil and gas well database and the production volumes. All data compiled by the State were included in the creation of this dataset. The dataset includes all producing and listed non-producing wells, as well as some proposed well locations. The maps are intended to provide an overview of the oil and gas resources in the area, but they do not provide detailed information on individual wells or fields.

Producing gas well: A well that is currently producing gas. 
Non-producing gas well: A well that is not currently producing gas but has produced gas in the past. 
Abandoned oil and gas well: A well that has been abandoned and is no longer producing.
Producing oil well: A well that is currently producing oil. 
Non-producing oil well: A well that is not currently producing oil but has produced oil in the past. 
Abandoned oil well: A well that has been abandoned and is no longer producing oil.

North America is oriented to the left. The map scale of 1:100,000 was chosen because it is large enough to plot individual wells, but small enough to provide an overview of the oil and gas resources in the area. The map includes all producing and listed non-producing wells, as well as some proposed well locations. The maps are intended to provide an overview of the oil and gas resources in the area, but they do not provide detailed information on individual wells or fields.

The maps were created by the Kentucky Geological Survey and are available for free download from the Kentucky Geological Survey website. The maps are available in PDF format and can be downloaded directly from the website. The maps are also available on CD-ROM and can be purchased from the Kentucky Geological Survey.

The Kentucky Geological Survey is a part of the University of Kentucky and is located in Lexington, Kentucky. The Survey publishes a variety of maps and reports on the geology and resources of Kentucky. The Survey is also responsible for the development and maintenance of the Kentucky Geological Survey database, which includes information on all oil and gas wells in the state.
