Brush Creek watershed (051002-05-400)

**Geography.** The Brush Creek watershed covers northeastern Owen County and an edge of Grant County. The land is in the hills of the bluegrass subregion of the Bluegrass physiographic region, characterized by hilly terrain, very rapid surface runoff, and slow groundwater drainage. Parts of the watershed lie over interbedded shales and limestones (these are 20% limestone; water conduction is poor because of the clay content of the shale). Other areas are underlain by interbedded limestones and shales (>20% limestone, allowing groundwater flow where the clay content is low enough).

**Waterways.** Brush Creek empties into Eagle Creek just over the Owen County line in Grant County, north of Jonesville. Among the creeks that feed it are Sand Lick Branch, Rudder Branch, Slab Lick Branch, Long Branch, and Buffalo Branch.

**Land and water use.** Land in the watershed is more than 75% agricultural and about 25% rural and wooded. No businesses or organizations hold permits for discharges into the creeks. See the 2000 Assessment Report for full details.

**Agency data assessment.** The assessed creek segment in this watershed fully supports all its designated uses, based on biological and/or water-quality data. See the 2000 Assessment Report or 2000 305(b) list and the 2002 303(d) list of impaired streams for full details.
Watershed Highlights

Watershed covers 25 square miles. The potential for agricultural erosion is substantially higher than the basin average.

See the color map of this region on p. 139.
