

Developing a yield loss prediction tool for Asian Soybean rust

S. Kumudini, C. Godoy, J. Board,
J. Omielan, E. Prior, D. Hershman and B. Kennedy

Challenge

- Develop a yield loss prediction tool for ASR
 - **Phase I:** How ASR reduces soybean yield? (Brazil)
 - **Phase II:** Develop a yield loss prediction Model for ASR (KY and LA)
 - **Phase III:** Model validation study (FL)
 - **Phase IV:** Software development

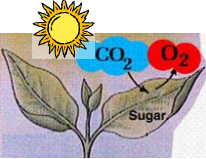

Yield

$$Y_g = Y_b \times HI$$

$$Y_b = \int_t (\overset{\text{Sun}}{Q} \times \underset{\text{Sun}}{I_a} \times \epsilon) dt$$

Phase I Objective

Determine how ASR reduces soybean yield: Is ASR-induced yield loss due to defoliation injury?

$$Y_b = \int_t (\overset{\text{☀}}{Q} \times I_a \times \epsilon) dt$$

Objective: Determine the role of defoliation injury on ASR-induced yield loss

Embrapa Soja, Londrina, Brazil

Phase I. Determine how ASR reduces soybean yield? Londrina, Brazil

Cultivar BRS 154 (MG VII)
Rows 45 cm (~18 inches)

Materials and Methods

- RCBD design, 6 replications
- Five treatments
 1. ASR - R1

Materials and Methods

- RCBD design, 6 replications
- Five treatments
 1. ASR - R1
 2. Mimic “ASR” at R1

Materials and Methods

- RCBD design, 6 replications
- Five treatments
 1. ASR - R1
 2. Mimic “ASR” at R1
 3. ASR - R5

Materials and Methods

- RCBD design, 6 reps
- Five treatments
 1. ASR - R1
 2. Mimic - R1
 3. ASR - R5
 4. Mimic - R5

Materials and Methods

- RCBD design, 6 reps
- Five treatments
 1. ASR - R1
 2. Mimic - R1
 3. ASR - R5
 4. Mimic - R5
 5. Control

Materials and Methods

- Measured Leaf Area Index
- Disease severity
- Yield

Escala Diagramática para ferrugem da soja

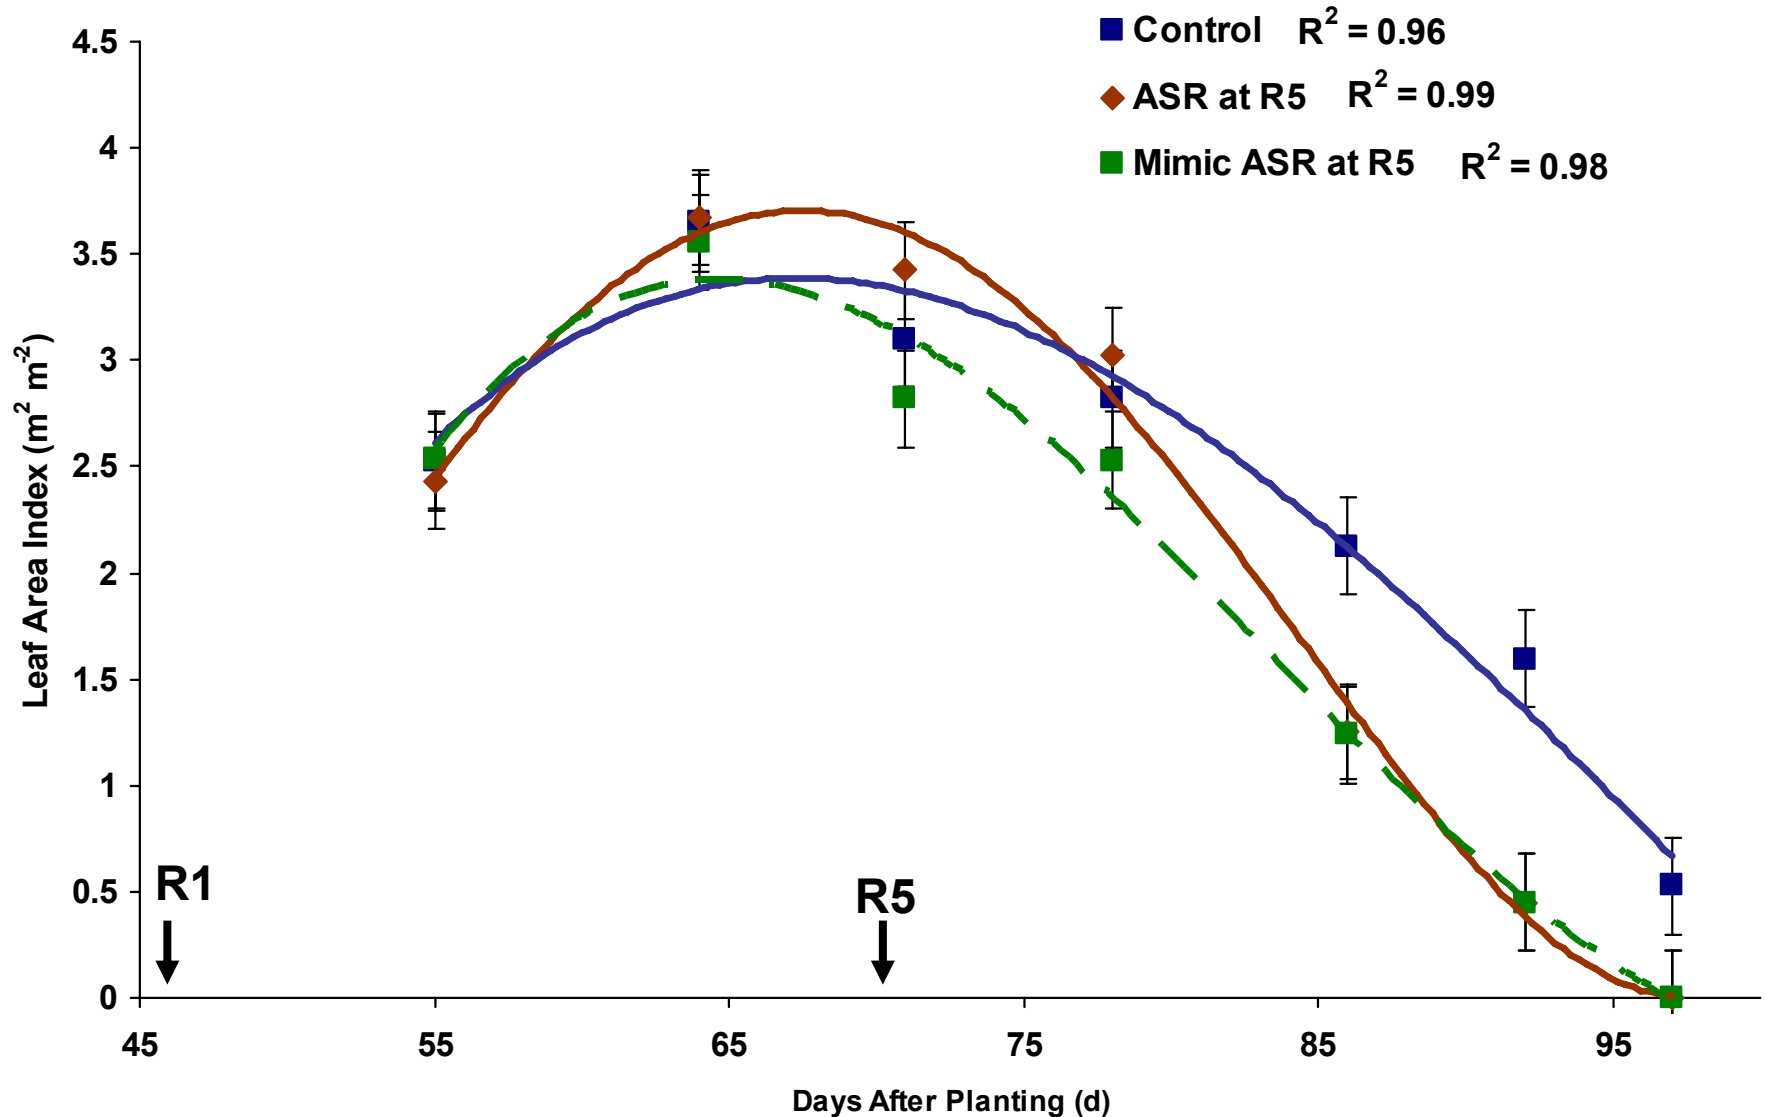

Results and Discussion

Plants infected at R1, leaf area over time - 2005/2006

Plants infected at R5, leaf area over time - 2005/2006

Role of defoliation injury in yield loss?

vs.

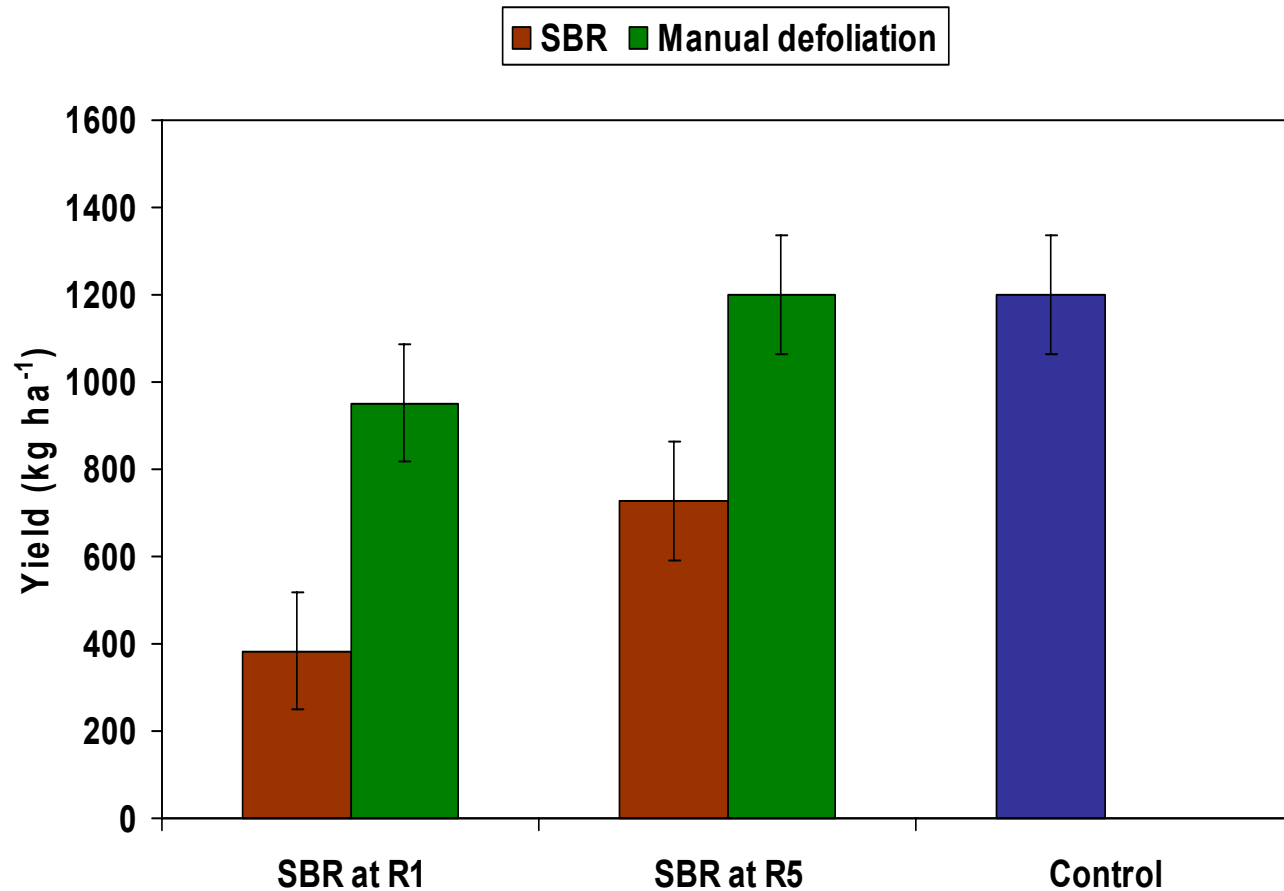

ASR-infected plot (ASR at R1)

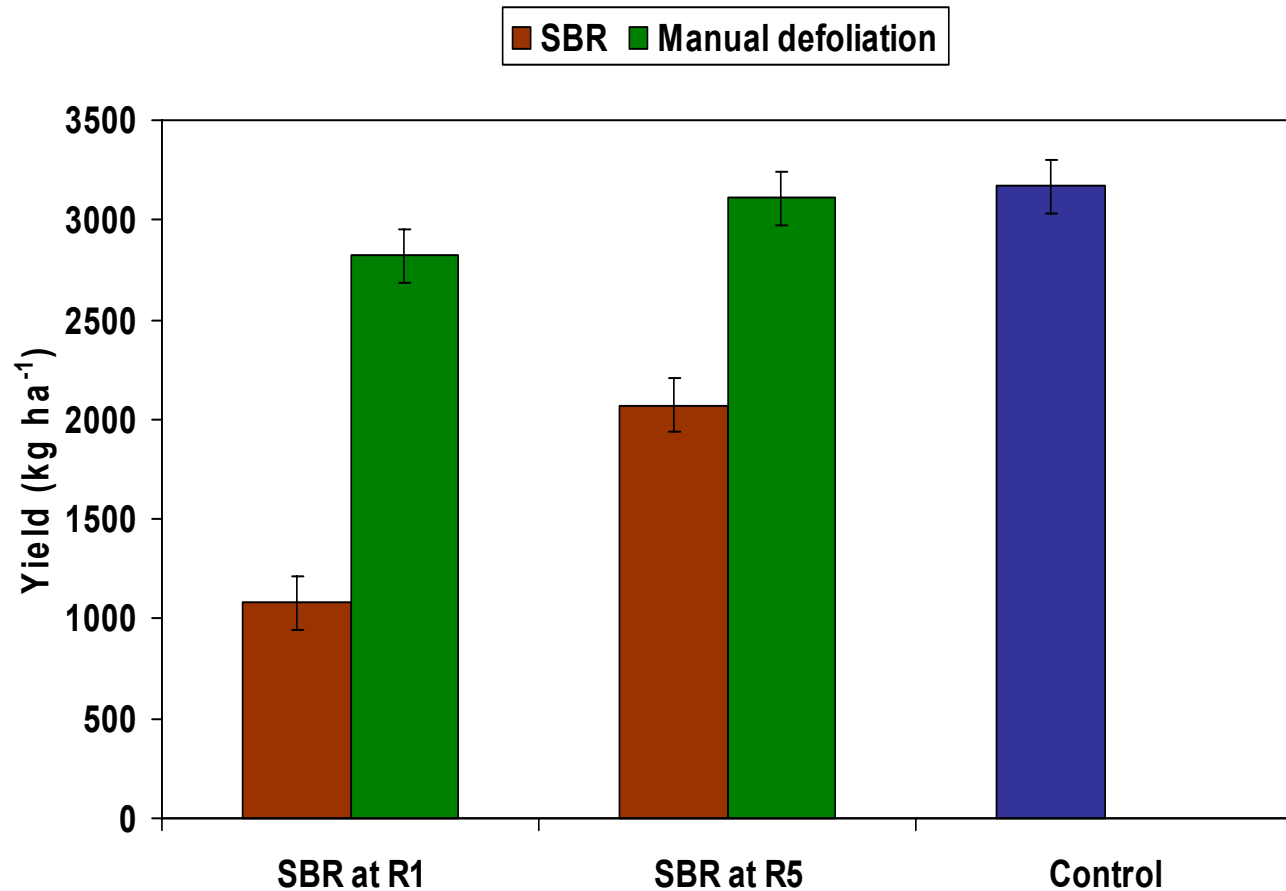

**Mimic ASR at R1
Fungicide treated, and manually
defoliated to mimic ASR- plots**

Plants around R6

Impact of ASR on yield - 2005/2006

Impact of ASR on yield - 2006/2007

$$Y_b = \int_t (\overset{\text{☀}}{Q} \times \underset{\text{☀}}{I_a} \times \varepsilon) dt$$

$$\text{Absorbed PAR} = \sum [\text{PAR} \times (1 - e^{-k} \times \text{LAI})]$$

(by LAI)

Table of Absorbed radiation from R1 to R7 in 2005/2006 and 2006/2007

Treatment	Absorbed PAR (MJ m ⁻²)	Yield
	LAI	
-----2005/2006-----		
ASR-R1	238 b	
DF-R1	243 b	
Control	318 a	
-----2006/2007-----		
ASR-R1	278 b	
DF-R1	278 b	
Control	309 a	

**Table of Absorbed radiation from R1 to R7, and yield
in 2005/2006 and 2006/2007**

Treatment	Absorbed PAR (MJ m ⁻²)	Yield
	LAI	
-----2005/2006-----		
ASR-R1	238 b	384 c
DF-R1	243 b	952 b
Control	318 a	1200 a
-----2006/2007-----		
ASR-R1	278 b	1080 b
DF-R1	278 b	2820 a
Control	309 a	3170 a

Close look at ASR-infected plot

Non-abscised ASR-infected leaf

Green leaf area index (GLAI)
 $GLAI = LAI \times (1 - \text{disease severity})$

$$Y_b = \int_t \underbrace{(Q \times I_a \times \varepsilon)}_{\text{Absorbed PAR}} dt$$

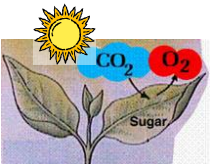

$$\text{Absorbed PAR} = \sum [\text{PAR} \times (1 - e^{-k \times \text{GLAI}})]$$

(by GLAI)

Table of radiation absorbed by leaf area, and green leaf area from R1 to R7 in 2005/2006 and 2006/2007

Treatment	Absorbed PAR (MJ m ⁻²)		Yield
	LAI	GLAI	
-----2005/2006-----			
ASR-R1	238 b	193 c	384 c
DF-R1	243 b	232 b	952 b
Control	318 a	311 a	1200 a
-----2006/2007-----			
ASR-R1	278 b	238 c	1080 b
DF-R1	278 b	276 b	2820 a
Control	309 a	305 a	3170 a

Biological Yield

$$Y_b = \int_t (Q \times I_a \times \epsilon) dt$$

The diagram shows a sun icon above a plant. Arrows indicate the intake of CO₂ (blue bubble) and the release of O₂ (red bubble). A label 'Sugar' points to the plant's internal process.

What is the impact of ASR on radiation use efficiency (RUE)?

Objective: What is the impact of ASR on RUE?

■ Study in Quincy, FL

- North Florida Research and Education Center
- Cultivar DP 72200-RR
- Row widths 36"
- Fungicide: Headline ASR

Controlled Environment Study - KY

Main plot: High, zero disease severity

Split plot: Resistant versus Susceptible RILs

Split-split plot: pre-sporulating versus post sporulating

Measurements

- Selected sun-lit, upper canopy leaves with variation in disease severity
- Net photosynthetic rate
- Disease severity

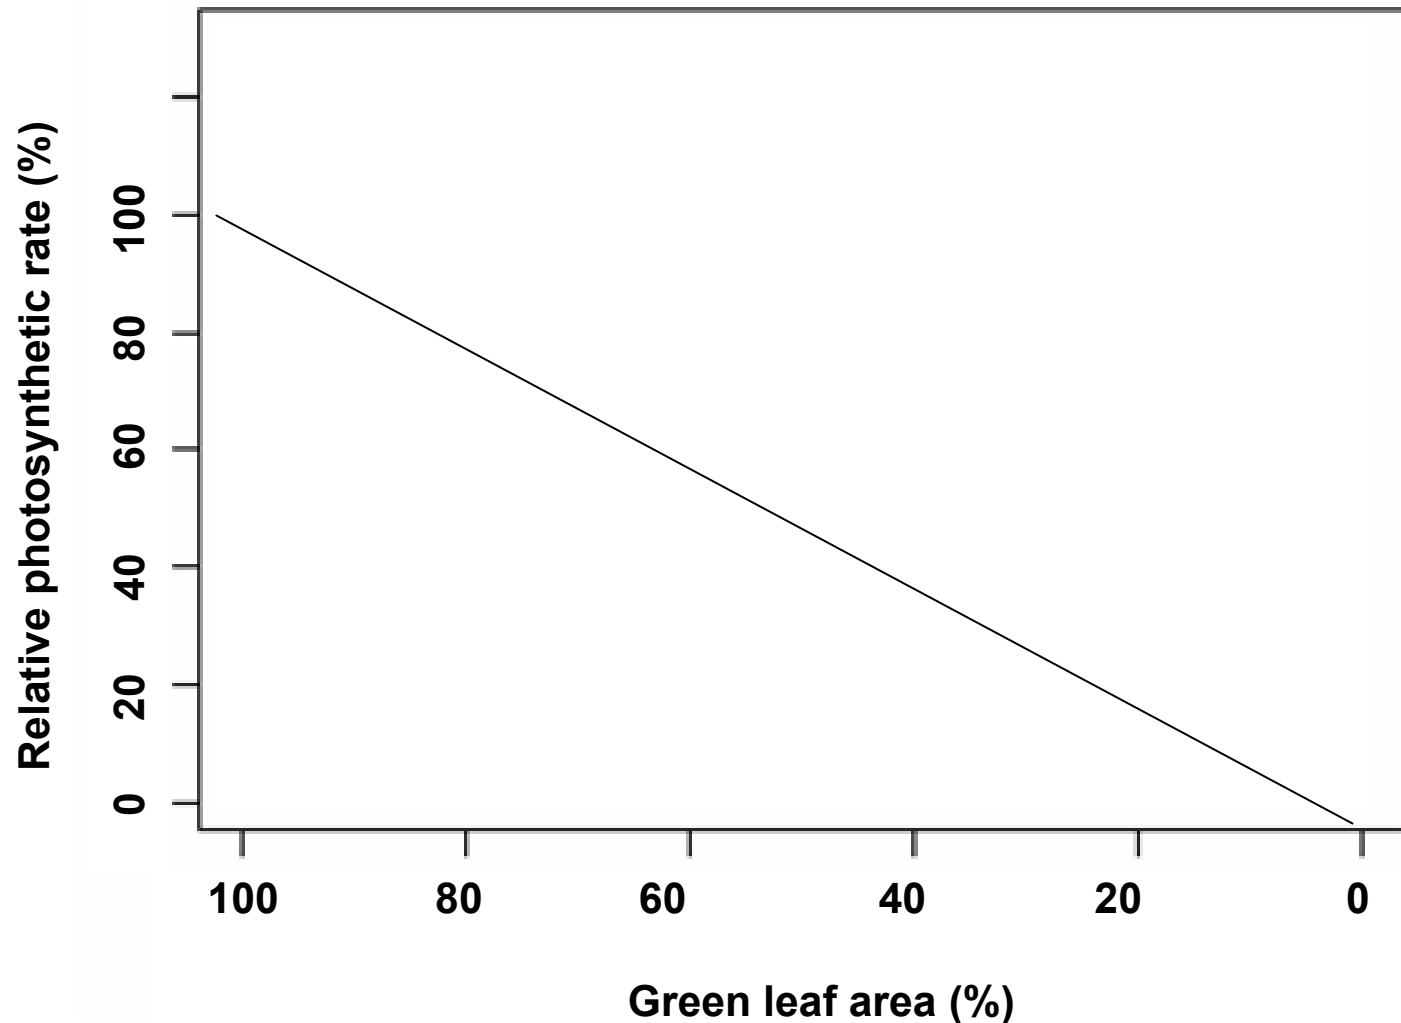

Impact of ASR lesions on photosynthesis - Growth chamber data from Lexington, KY

Impact of ASR lesions on photosynthesis - Field data from Quincy, FL

Table of RUE from R1 to R7, and yield in 2005/2006 and 2006/2007

Treatment	RUE (g MJ ⁻¹)	Yield
-----2005/2006-----		
ASR-R1	0.85 b	384 c
DF-R1	1.21 a	952 b
Control	0.89 ab	1200 a
-----2006/2007-----		
ASR-R1	1.00 b	1080 b
DF-R1	1.88 a	2820 a
Control	1.63 a	3170 a

Biological Yield

$$Y_b = \int_t (Q \times I_a \times \epsilon) dt$$

Effects of ASR and manual defoliation starting on biomass at maturity

A. 2005/2006 growing season

B. 2006/2007 growing season

Grain Yield

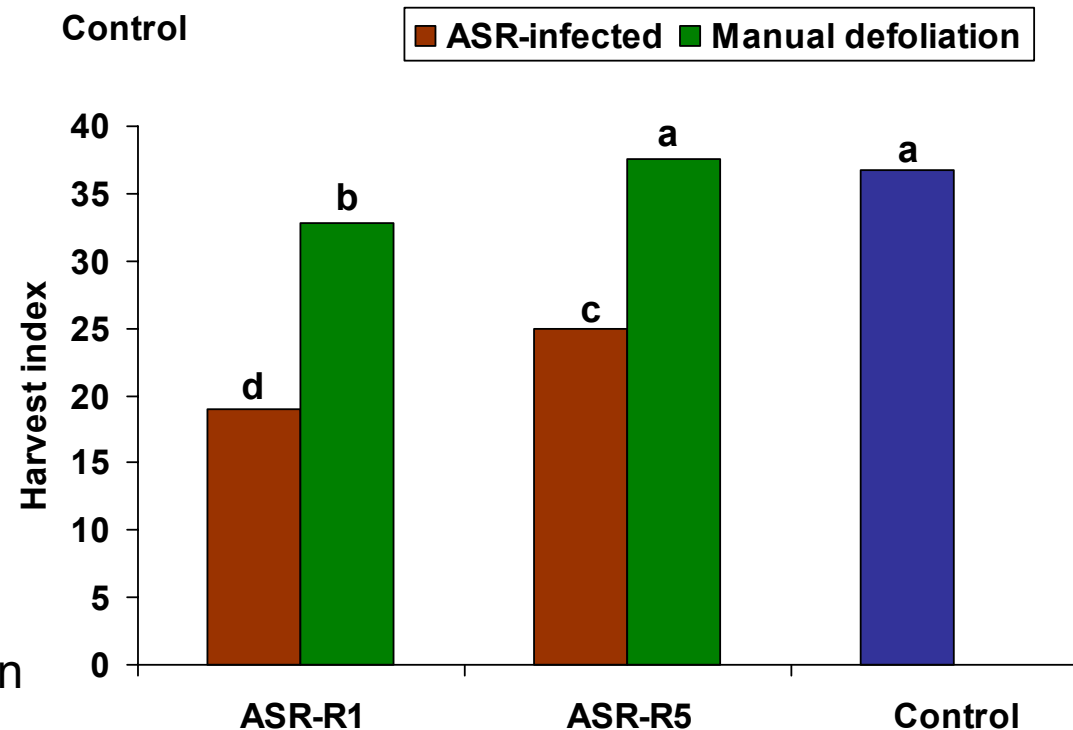

$$Y_g = Y_b \times HI$$

Effects of ASR and manual defoliation on harvest index

A. 2005/2006 growing season

Summary

ASR-induced yield loss was a function of:

- i. Leaf loss, resulting in a reduction in light absorption.

reduction in
green leaf

non-

- iv. Reduction in **both** crop biomass and harvest index

Summary

ASR-induced yield loss was a function of:

- i. Leaf loss, resulting in a reduction in light absorption.
- ii. Disease lesions, resulting in a reduction in light absorption by reducing green leaf area.
- iii. Reduction in photosynthesis of the non-lesion green leaf area.
- iv. Reduction in seed yield due to reduction in **both** crop biomass accumulation and harvest index.

What's next ?

- Validate the model under ASR-infected conditions in the USA (**Phase III**)
