Reliability, minimal detectable change, and responsiveness of the Quick-FAAM ★Johanna M. Hoch <sup>a,\*,</sup>  , Cameron J. Powden <sup>b,</sup>  , Matthew C. Hoch <sup>c,</sup>  [Show more](#)<https://doi.org/10.1016/j.pts.2018.04.004>[Get rights and content](#)

## Highlights

- The Quick-FAAM has acceptable test re-test reliability.
- The Quick-FAAM is responsive in patients with CAI who completed a 4-week rehabilitation.
- The acceptability and feasibility of this instrument should be determined.

## Abstract

## Objective

To determine the **test-retest reliability**, **minimal detectable change** (MDC) and responsiveness of the Quick-FAAM in people with chronic **ankle instability** (CAI).

## Design

10-week controlled laboratory study.

## Setting

Laboratory.

## Participants

A total of 20 adults with self-reported CAI.

## Main outcome measures

Participants completed a supervised 4-week intervention. The Quick-FAAM was assessed 4-weeks before the intervention (T1), prior to the first intervention (T2), 24-h post-intervention (T3), and 2-weeks after the intervention (T4). The Quick-FAAM is a 12-item region specific PRO scored on 5-point **Likert scale**, often reported as a percentage, and a lower percentage indicates decreased ankle function. Test-retest reliability was determined using **Intraclass-correlation coefficients** (ICC<sub>2,1</sub>) and standard error of measure (SEM). The MDC was calculated using the equation: SEM\*√2. Hedges g effect sizes and associated 95% **confidence intervals** (95%CI) were calculated as a measure of group responsiveness.

## Results

The test-retest reliability was clinically acceptable (ICC<sub>2,1</sub>=0.82, SEM=4.56). The MDC was 6.5% and pre-post intervention effect sizes were large between T2-T3 (ES=1.27, 95%CI:0.59–1.95) and T2-T4 (ES=1.49, 95%CI:0.79–2.19).

## Conclusion

The Quick-FAAM demonstrated clinically acceptable reliability and was responsive to treatment. Future research should examine these properties in patients with acute ankle and foot conditions, determine patient acceptability, and clinician feasibility.
