

# Kentucky Fruit Facts

November 2002 (11/02)

Fruit Facts can be found on the web at: <http://www.ca.uky.edu/HLA/fruitfact/>

John Strang, Extension Fruit Specialist, Editor  
Marilyn Hooks & Karen Shahan, Staff Assistants

## Fruit Crop News

by John Strang, Extension Horticulturist  
and Tom Priddy, Ag. Meteorologist

Fruit growers should be thinking about destroying dropped fruit and tall weeds in the orchard, as well as eliminating weed cover in the fence rows. This will help to destroy vole tunnels and reduce vole and rabbit damage. Applying a zinc phosphide bait is recommended to help control voles.

Peach growers might want to get their peach leaf curl spray on this fall after leaf drop. This eliminates the worry that you won't get the spray on before bud swell occurs. Once bud swell begins, sprays for peach leaf curl provide little or no control. Ferbam provides good control. Copper by itself will do a good job where leaf curl problems have been low. However, if bacterial spot has been a problem, use copper plus Ferbam or Ziram.

All growers should be tending to equipment repairs and winterizing their equipment. It

is much easier to take care of repairs now, because orchard operations becomes too hectic once the season starts.

This past seasons growing seasons weather has been extreme. By the end of October Kentucky had experienced the 7<sup>th</sup> wettest spring (18.88 inches), the 16<sup>th</sup> warmest April, the 11<sup>th</sup> hottest and 16<sup>th</sup> driest summer, and the wettest combined September and October (11.71 inches) in the past century.

## Upcoming Meetings

**Nov 19-21 - Small Farm Conference, "The Barefoot Farmer", USDA Agencies, Certified Kitchens and Grant Writing Tips.** Kentucky State University Research Farm, 1525 Mills Lane, Frankfort, KY. Registration is required for the conference, but there is no registration for those attending the Third Thursday Program only. Contact Louie Rivers, Jr. 502/597-6327 or 502/597-9505.

**Dec 2 - Grower Meeting to Contract Fruit for Valentine's Kentucky Gourmet Ice Cream,** 6:30 p.m., Fayette County Extension Office, 1140 Red Mile Place, Lexington, KY. Contact Doug Jones: e-mail [jones8079@aol.com](mailto:jones8079@aol.com) or Nick Carter 859/257-5582. See write up below.

**March 4-5 - Small Fruit and Strawberry School**, Holiday Inn, Mt. Vernon, IL.

## Valentine's Kentucky Gourmet Ice Cream is "looking"

By Doug Jones, Marketing Manager

You've heard the expression, "where's the beef?" Valentine's says, "where's the fruit?" This year old Lexington (formerly Winchester) company makes super premium ice cream. Current distribution is in the Bluegrass, Louisville and Cincinnati markets. The company services retail accounts, plus restaurants and country clubs. Valentine's is the sole manufacturer of a line of bourbon ice creams in the USA (Brown-Forman Products).

Valentine's would like to expand its marketing and sales base using Kentucky grown, high quality fruits and berries. Besides super premium ice cream, sorbets, gelatos and sherbets, are also being made and sold. The problem..... 99% of the fruits used in this manufacturing operation come from the west coast, Michigan or South Carolina and Georgia.

**On December 2 (Monday)** about 6:30pm, a presentation will be made at the Fayette County Extension Office. Growers and producers who would like to be part of a growing/procurement program utilizing local fruits should come and ask questions. Besides ice cream flavorings, purees offer a major sales opportunity.

Valentine's believes that Kentucky farmers can produce high quality fruit for value added products. Let us know if this is, something you think could be profitable and in which you would want to become involved. Most will likely come from counties near Fayette. However, highly motivated, interested producers outside this trade area are also invited to attend and evaluate the feasibility of participation. We are interested in purchasing most fruit types that are grown in Kentucky.

Valentine's is a 100% private sector funded and run operation. At some point in time, grants may be sought for equipment to increase production capacity. If your interest is peaked by the article, please RSVP to save a seat and enjoy some great ice cream with us.

Scott Berryman, President  
Doug Jones, Marketing

## Season Summary and Fruit and Nut Crop Estimates, 2002

by John Strang, Terry Jones, Joe Masabni, Ric Bessin, John Hartman, and Leslie Wilmoth

The 2002 season had an unusually warm fall, and mild winter. January temperatures were 7-10° F above normal and reached 60° to 70° F causing some buds to swell. On March 4<sup>th</sup> temperatures dropped into the single digits

(4-6° F) and on March 22 temperatures dropped into the mid-teens. We lost quite a few peach buds and the king bloom on some apple varieties in a number of orchards. On May 21st and 22nd we experienced particularly late freezes that killed more peach and apple blooms. The late freeze was particularly hard on grapes in low lying areas, which had made extensive growth by this time. Extremely warm temperatures in April set us up for severe fire blight in the central and eastern portions of the state.

Statewide, wet weather generally prevailed in March, April, and May, but dry weather was prevalent during June, July, and August. Rain was spotty, and some locales suffered severe drought while others suffered only moderate drought. One grower in the Owensboro area reported that he went 120 days without rain. Summer temperatures were above normal.

Despite this most growers reported fairly decent crops. Harvest was a little earlier for some growers or slightly later than normal for others.

Japanese beetle levels in the central and eastern portion of the state were low to moderate, but showed a resurgence in this area from recent years. In the western half of the state Japanese beetle numbers were low to high depending on the location. Green June beetle was at higher than normal levels attacking peaches, brambles, and grapes. Several orchards (peach and apple) are experiencing increasing levels of San Jose scale on trees and fruit. This may be due to a shift in insecticide use patterns resulting from FQPA restrictions.

## **Apples**

Kentucky growers produced an apple crop that averaged about 70% of normal. However, this ranged from 100% for some growers to 10% for a few growers. Fruit color was less than desired, finish was generally fairly good and size was a little on the small size for many growers. Cork spot and bitter pit were present in orchards with lighter crops and 'Gala' and 'Red Delicious' showed occasional frost ringing. Apple sales were generally good.

Rain and long periods of spring leaf wetness increased the occurrence of primary infections of apple scab (*Venturia inaequalis*) and cedar rust (*Gymnosporangium juniperi-virginianae*, *G. clavipes*, and *G. globosum*).

Periodically mild spring weather and showers during apple and pear bloom resulted in significant fire blight (*Erwinia amylovora*) in those areas of the state where bloom, warm weather, and rain coincided. Spring frosts occurred and may have exacerbated fire blight. Spring rains also favored apple frog-eye leaf spot (*Sphaeropsis malorum*). Dry summer weather reduced incidence of secondary apple scab and apple sooty blotch (*Peltaster fructicola*, *Geastrumia polystigmatis*, *Leptodontium elatius*, and other fungi) and flyspeck (*Zygophiala jamaicensis*), all of which are enhanced by long leaf wetness periods. Bitter rot (*Colletotrichum gloeosporioides*) was found in some apple orchards. Apple southern blight (*Sclerotium rolfsii*) was found in a newly planted orchard.

Codling moth levels across the state were generally typical. One orchard in central Kentucky where serious damage has occurred for the last two years, despite low codling moth pheromone trap captures was found to be having Oriental fruit moth problems. An orchard in south central Kentucky had very high levels of woolly apple aphid and ribbed cocoon maker on some varieties. Winesap was particularly hard hit. European red mite levels were again low in Kentucky despite the drought for most growers.

## **Stone Fruit**

The peach crop is estimated to be about 80% of normal and quality was excellent. Surprisingly Japanese plums produced a crop and European Plums did well.

Winter and spring freezes resulted in some tree fruit injury that could have exacerbated stone fruit Cytospora (*Leucostoma persoonii*) cankers. As leaves emerged, peach leaf curl disease (*Taphrina deformans*) appeared. Spring rains favored peach scab (*Cladosporium carpophilum*) bacterial canker (*Pseudomonas mors-prunorum*), bacterial leaf spot (*Xanthomonas campestris* pv. *pruni*) and brown rot (*Monilinia fructicola*).

## **Pears**

The European pear crop ranged from 10 to 100% of normal and Asian pears produced from 20 to 100% of a normal crop. Stink bugs continue to be a problem in Asian pears. Fire blight (*Erwinia amylovora*) was severe in a number of plantings, particularly Asian pears.

## Strawberries

The strawberry crop was estimated to be about 75% of normal due to the spring freeze. Greenhouse strawberries were subject to powdery mildew (*Sphaerotheca macularis* f.sp. *fragariae*) and in the field strawberry leaf spot (*Mycosphaerella fragariae*) was common.

## Blackberries

The thorny and thornless blackberry crop ranged from 50 to 100% of normal. Some blackberries, particularly those in central and eastern Kentucky lost flowers to the late spring freeze. Systemic orange rust (*Gymnoconia nitens*) and blackberry rosette (*Cercospora rubi*) were frequently observed.

## Grapes

The grape crop was smaller than expected for many growers and ranged from 30 to 100% of normal. The late spring freeze eliminated many primary buds and some growers had fruit from primary and secondary buds on the same vines, presenting problems with harvest.

Grape crown gall (*Agrobacterium tumefaciens*) continues to be a very serious problem for growers. Wet spring weather favored black rot (*Guignardia bidwellii*) and anthracnose (*Elsinoe ampelina*). Several cases of grape downy mildew (*Plasmopara viticola*) were observed. Pierce's disease (*Xylella fastidiosa*) in western Kentucky was confirmed. Summer air stagnation caused ozone injury to many plants and was especially noticeable on grapes.

Birds and Green June beetles were a serious problem for some growers. Wasp, hornet and bee problems in grapes were exacerbated by the summer drought. Grape root borer appears to be on the increase as many of the new grape plantings begin to reach maturity.

## Blueberries

Blueberries produced a full crop this season. Bird problems were normal.

## Nuts

All the nut crops other than chestnuts did poorly this year. Rainy weather during bloom inhibited nut set and retention and the very hot dry summer led to poor nut fill on the nuts that did set.

### 2002 Percentage of Normal Full Crop for Kentucky

<u>Fruit</u>	<u>Percent of Full Crop</u>	<u>Range(%)</u>
<u>Tree Fruit</u>		
Apples	70	10 - 100
